

Minor Project: Static Website Hosting Using EC2 and S3

Project Objective

Launch an EC2 instance, install Apache Web Server, create an S3 bucket, upload website backup files to S3, and access the website using the EC2 Public IP.

Architecture

User -> EC2 Instance (Apache Web Server) -> S3 Bucket (Backup Storage)

Services Used

Amazon EC2 for hosting the website and Amazon S3 for storing backups.

Step 1: Launch EC2 Instance

Create an EC2 instance using Amazon Linux 2023, t2.micro, and allow ports 22 and 80.

Step 2: Connect to EC2

Use SSH with the generated key pair to connect to the instance.

Step 3: Install Apache

Install and start Apache Web Server using dnf package manager.

Step 4: Create Website

Create an index.html page under /var/www/html and verify the website using the public IP.

Step 5: Create S3 Bucket

@UnloxAcademy

Create a unique S3 bucket and upload website backup files.

Deliverables

Submit screenshots of EC2 instance, security groups, website page, S3 bucket, and uploaded files.

Learning Outcomes

Understand EC2, S3, Apache installation, web hosting, and AWS infrastructure basics.

Viva Questions

What is EC2? What is S3? What is Apache? Why are security groups used? Difference between EC2 and S3?
